The authors have retracted this article after being notified of errors in the paper and independently identifying further issues. First, area-weighted grid cells were not used when calculating study-wide averages, an error that affected numerical values in the main text, Fig. 1b, and Extended Data Figs. 4 and 8. Second, results based on GLEAM v3 instead of GLEAM4 were inadvertently used in Extended Data Fig. 4: the two datasets are largely consistent for 1981–2021, but the area weighting based on GLEAM4 resulted in a reduced drought-affected area in 2022. Third, the underlying code included a timestepping error in the computation of regional drought-affected areas, meaning that dates were not properly parsed when subsetting the data for the 1981–2017 and 2018–2022 periods. This misclassification of time steps affected the

Large variability in response to projected climate and land-use changes among European bumblebee species

Reinhard Prestele✉, Calum Brown, Chiara Polce, Joachim Maes, Penelope Whitehorn

First published: 01 July 2021 | <https://doi.org/10.1111/gcb.15780> | Citations: 1

The native spatial resolution of the IAP2 at the **European extent** is **10 arcmin (WGS84; EPSG:4326)**. To obtain land uses for the **10 × 10 km grid**, we overlaid polygons projected to WGS84 with the IAP2 maps and aggregated the IAP2 land uses weighted by the 10 arcmin cell contribution to these polygons.

Il climate data were downloaded from www.worldclim.org at 10 arcmin spatial resolution (WGS84; EPSG:4326) and **projected to 10 × 10 km grids in Lambert azimuthal equal area projection (EPSG:3035)** using bilinear interpolation.

$$\Delta\sigma = \arctan \frac{\sqrt{(\cos \phi_2 \sin(\Delta\lambda))^2 + (\cos \phi_1 \sin \phi_2 - \sin \phi_1 \cos \phi_2 \cos(\Delta\lambda))^2}}{\sin \phi_1 \sin \phi_2 + \cos \phi_1 \cos \phi_2 \cos(\Delta\lambda)}.$$

BENT INTO SHAPE

The Mercator projection keeps longitudinal lines straight — but the trade-off is that it gradually stretches land masses the farther they are from the poles. The curved meridians in the Equal Earth projection means that the relative size of land masses is depicted more accurately.
